

Spreadsheet

Opening of Spreadsheet

To start working in Excel:

1. Search for "Excel" in the Windows Start menu and open **Microsoft Excel**.
2. From the start screen, select **Blank workbook** (or any template).
3. You can also double-click an existing .xlsx file to open it directly.

Here are some examples of the modern Microsoft Excel opening screen and blank workbook interface:

Addressing of Cells

Every cell in Excel has a unique **address**:

- Columns are labeled with letters (A, B, C, ..., Z, AA, AB, etc.)
- Rows are labeled with numbers (1, 2, 3, ...)
- A cell address is **column letter + row number**, e.g., **A1**, **B5**, **D10**.

Here are visual examples showing cell addressing in the grid:

Printing of Spreadsheet & Saving Workbooks

- **Save** → Ctrl + S or File → Save (updates the file).
- **Save As** → File → Save As → Choose location and name (default format: .xlsx).
- **Printing** → File → Print → Set printer, pages, orientation, scaling → Print.
- **Print Preview** appears in the same Print screen.

Manipulation of Cells

- **Entering Text, Numbers, and Dates** — Just click a cell and type (Excel auto-detects numbers/dates).

- **Creating Series** — Type first few values (e.g., 1, 2 or Jan, Feb) → Select them → Drag the **fill handle**
- (small square at bottom-right of selection) down/right to auto-fill series.
- **Editing Data** — Double-click cell or press F2 → edit → Enter.
- **Insert/Delete Rows/Columns** — Right-click row/column number → Insert or Delete.
- **Change Cell Height/Width** — Drag row/column borders or right-click → Row Height / Column Width.

Here are examples of AutoSum, inserting rows/columns, and adjusting sizes:

How to AutoSum in Excel

Formulas and Functions

Formulas start with = sign (e.g., =A1+B1).

- **Basic Operators** — + (add), - (subtract), * (multiply), / (divide), ^ (power).

- **AutoSum** — Select cells → Home tab → AutoSum (Σ) → It suggests SUM, AVERAGE, etc.
- **Functions** — Type = then function name (e.g., =SUM(A1:A10), =AVERAGE(B2:B20)).
- **Multiple Cell References** — =A1+A2+B3 or =SUM(A1:A5, C10:C15).
- **Finding the Right Function** — Formulas tab → Insert Function (fx) → Search by description.
- **Relative vs Absolute References:**
 - **Relative** (A1) — Changes when copied (default).
 - **Absolute** (\$A\$1) — Fixed when copied (press F4 to toggle \$ signs).

Here are examples of the **Formula Bar** with SUM and other functions:

Formula Bar in Excel

The screenshot shows an Excel spreadsheet with the following data:

	A	B	C	D	E	F
1	S.No	receipt_id	Item Code	Amount	GST	
2	1	127504425	heron_foods	4.75	1.2	5.95
3	2	125387159	heron_foods	3.07	1.2	4.27
4	3	118531884	heron_foods	30.92		
5	4	115178509	heron_foods	11.29		
6	5	120962192	heron_foods	12.83		
7	6	118427223	poundworld	33.17		
8	7	119727660	poundworld	24.7		
9						
10				Grand Total		131.73

The Formula Bar at the top shows the formula `=SUM(F2:F9)` for cell E10. The ribbon shows the 'View' tab with 'Formula Bar' checked. A callout box points to the Formula Bar with the text 'Formula Bar'.

Formula Bar in Excel | How to Use Formula Bar (Formula, Examples)

Here are clear visuals showing **relative vs absolute cell references** when copying formulas:

Comparison Table: Absolute vs. Relative vs. Mixed

Here's a simple table that summarizes how each reference type behaves when you copy a formula.

Reference Type	Example	When you copy DOWN	When you copy ACROSS
Relative	A1	Row and column change	Row and column change
Absolute	\$A\$1	Stays \$A\$1	Stays \$A\$1
Mixed (Row Locked)	A\$1	Row stays 1, column changes	Row stays 1, column changes
Mixed (Col Locked)	\$A1	Column stays A, row changes	Column stays A, row changes

Fixing Formula Errors — Common ones: #DIV/0! (divide by zero), #NAME? (wrong function name), #REF! (deleted reference). Use **Error Checking** button or Formulas → Error Checking.

Charts

Charts visualize data beautifully.

Steps to create:

1. Select your data range (including headings).
2. Insert tab → Charts group → Choose type (e.g., Column, Line, Pie).
3. Chart appears → Customize via Chart Design / Format tabs.

Here are step-by-step examples of creating a **column chart** from data:

[lifewire.com](https://www.lifewire.com)

Working with Graphics

- **Clip Art / Pictures** — Insert tab → Pictures (from file, stock images, or online).
- **SmartArt** — Insert tab → SmartArt → Choose category (e.g., Hierarchy, Process, Cycle) → Add text.

Here are beautiful examples of **SmartArt** graphics (like hierarchy or process charts) inserted in Excel:
